What are Physical Changes?

By: Keegan Lewellen

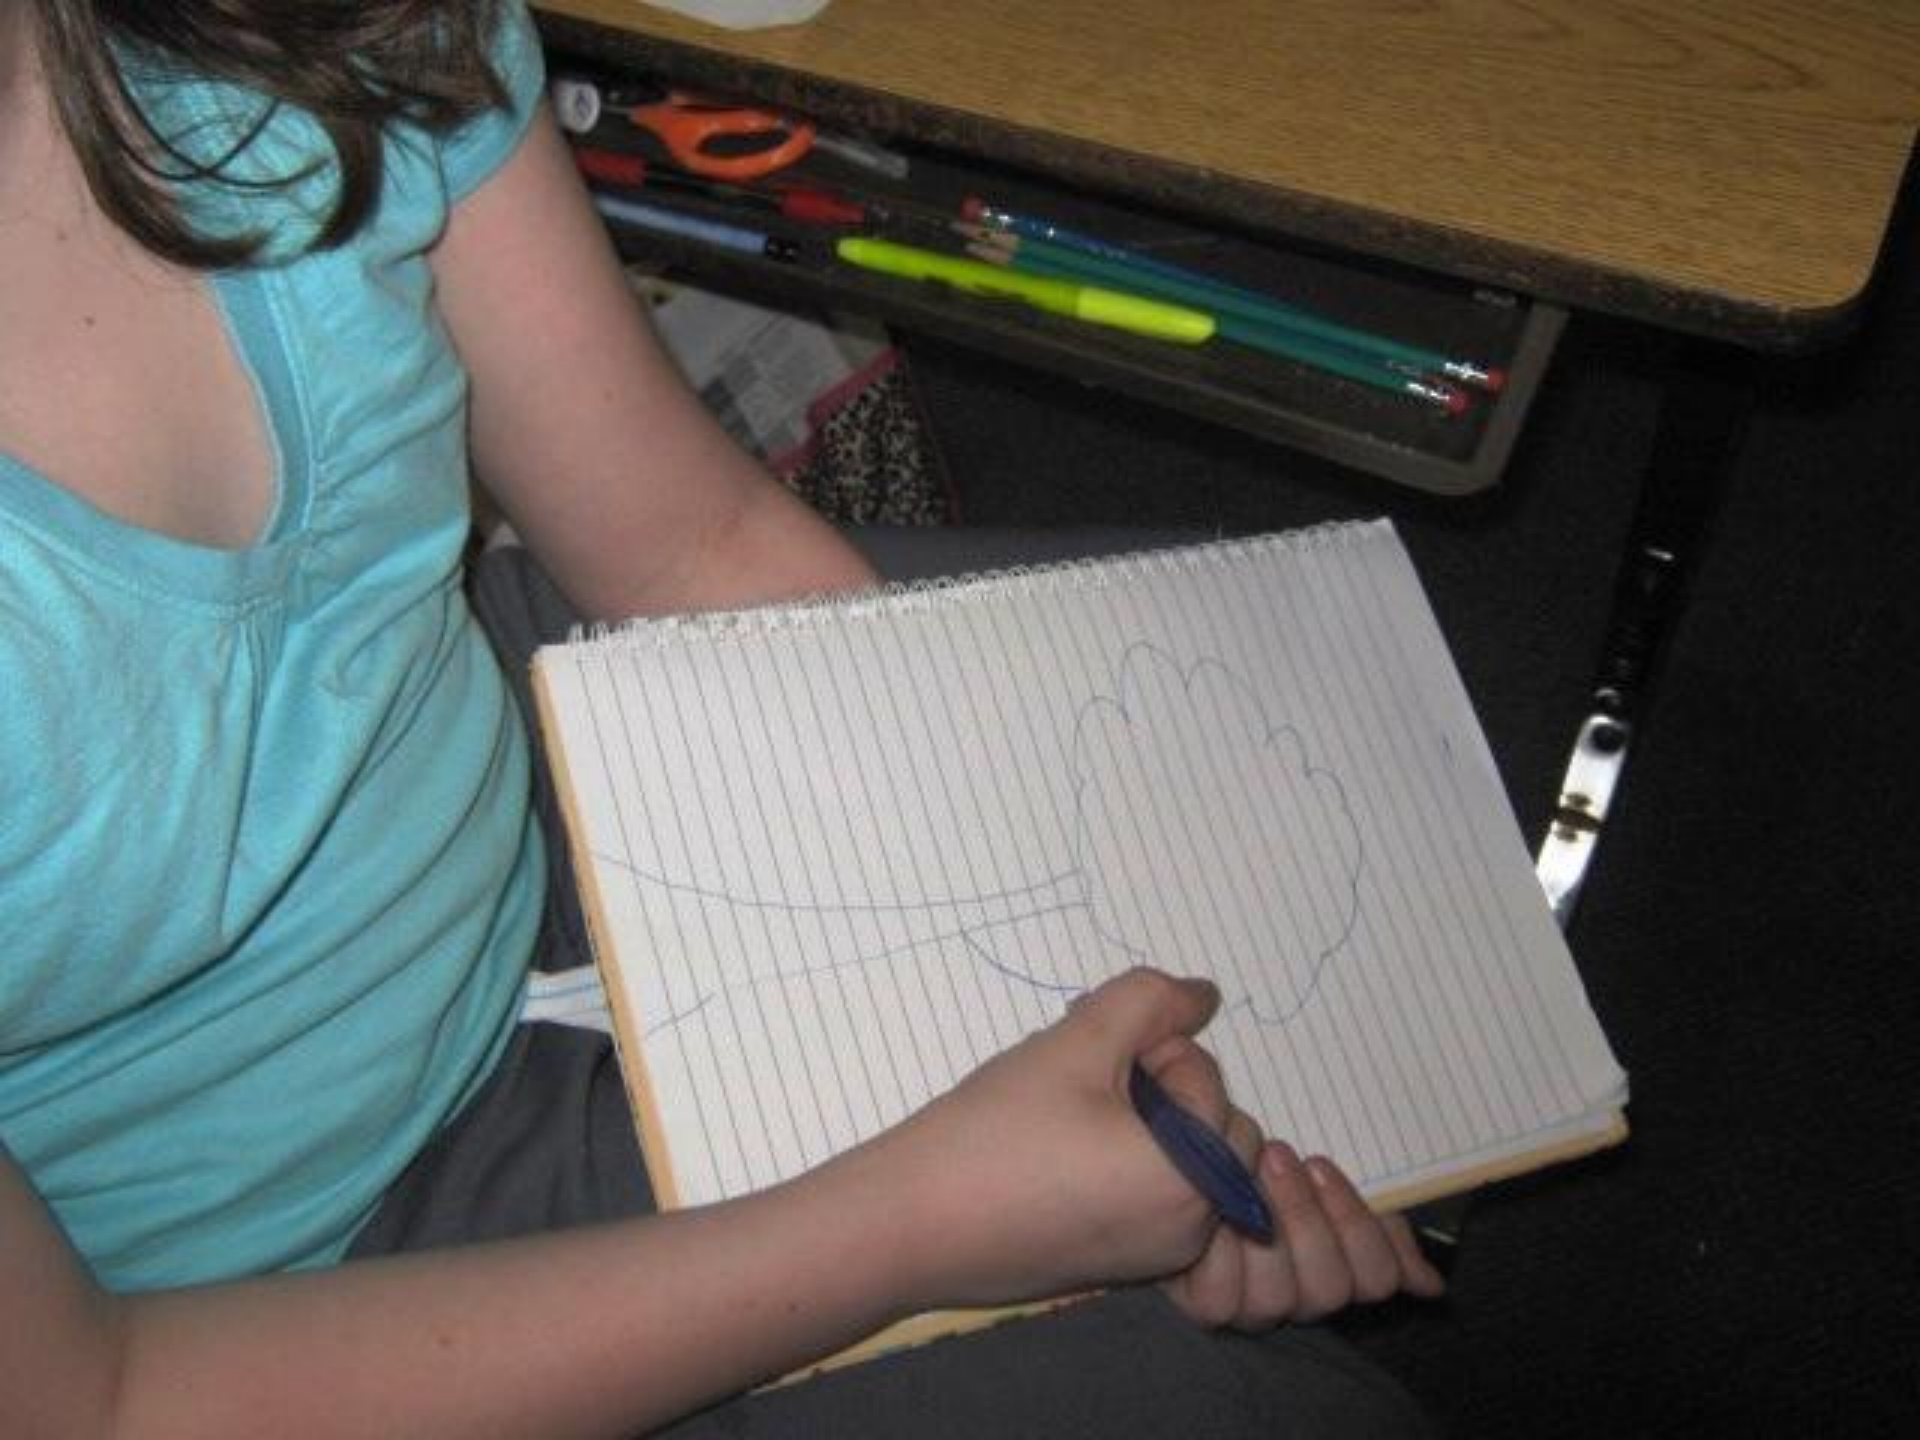

A physical change is like melting an ice cube. If you melt snow, you can refreeze it. Physical changes are important because if you become a scientist, you would do them. A chemical change is when you can't fix it, like burning a log.

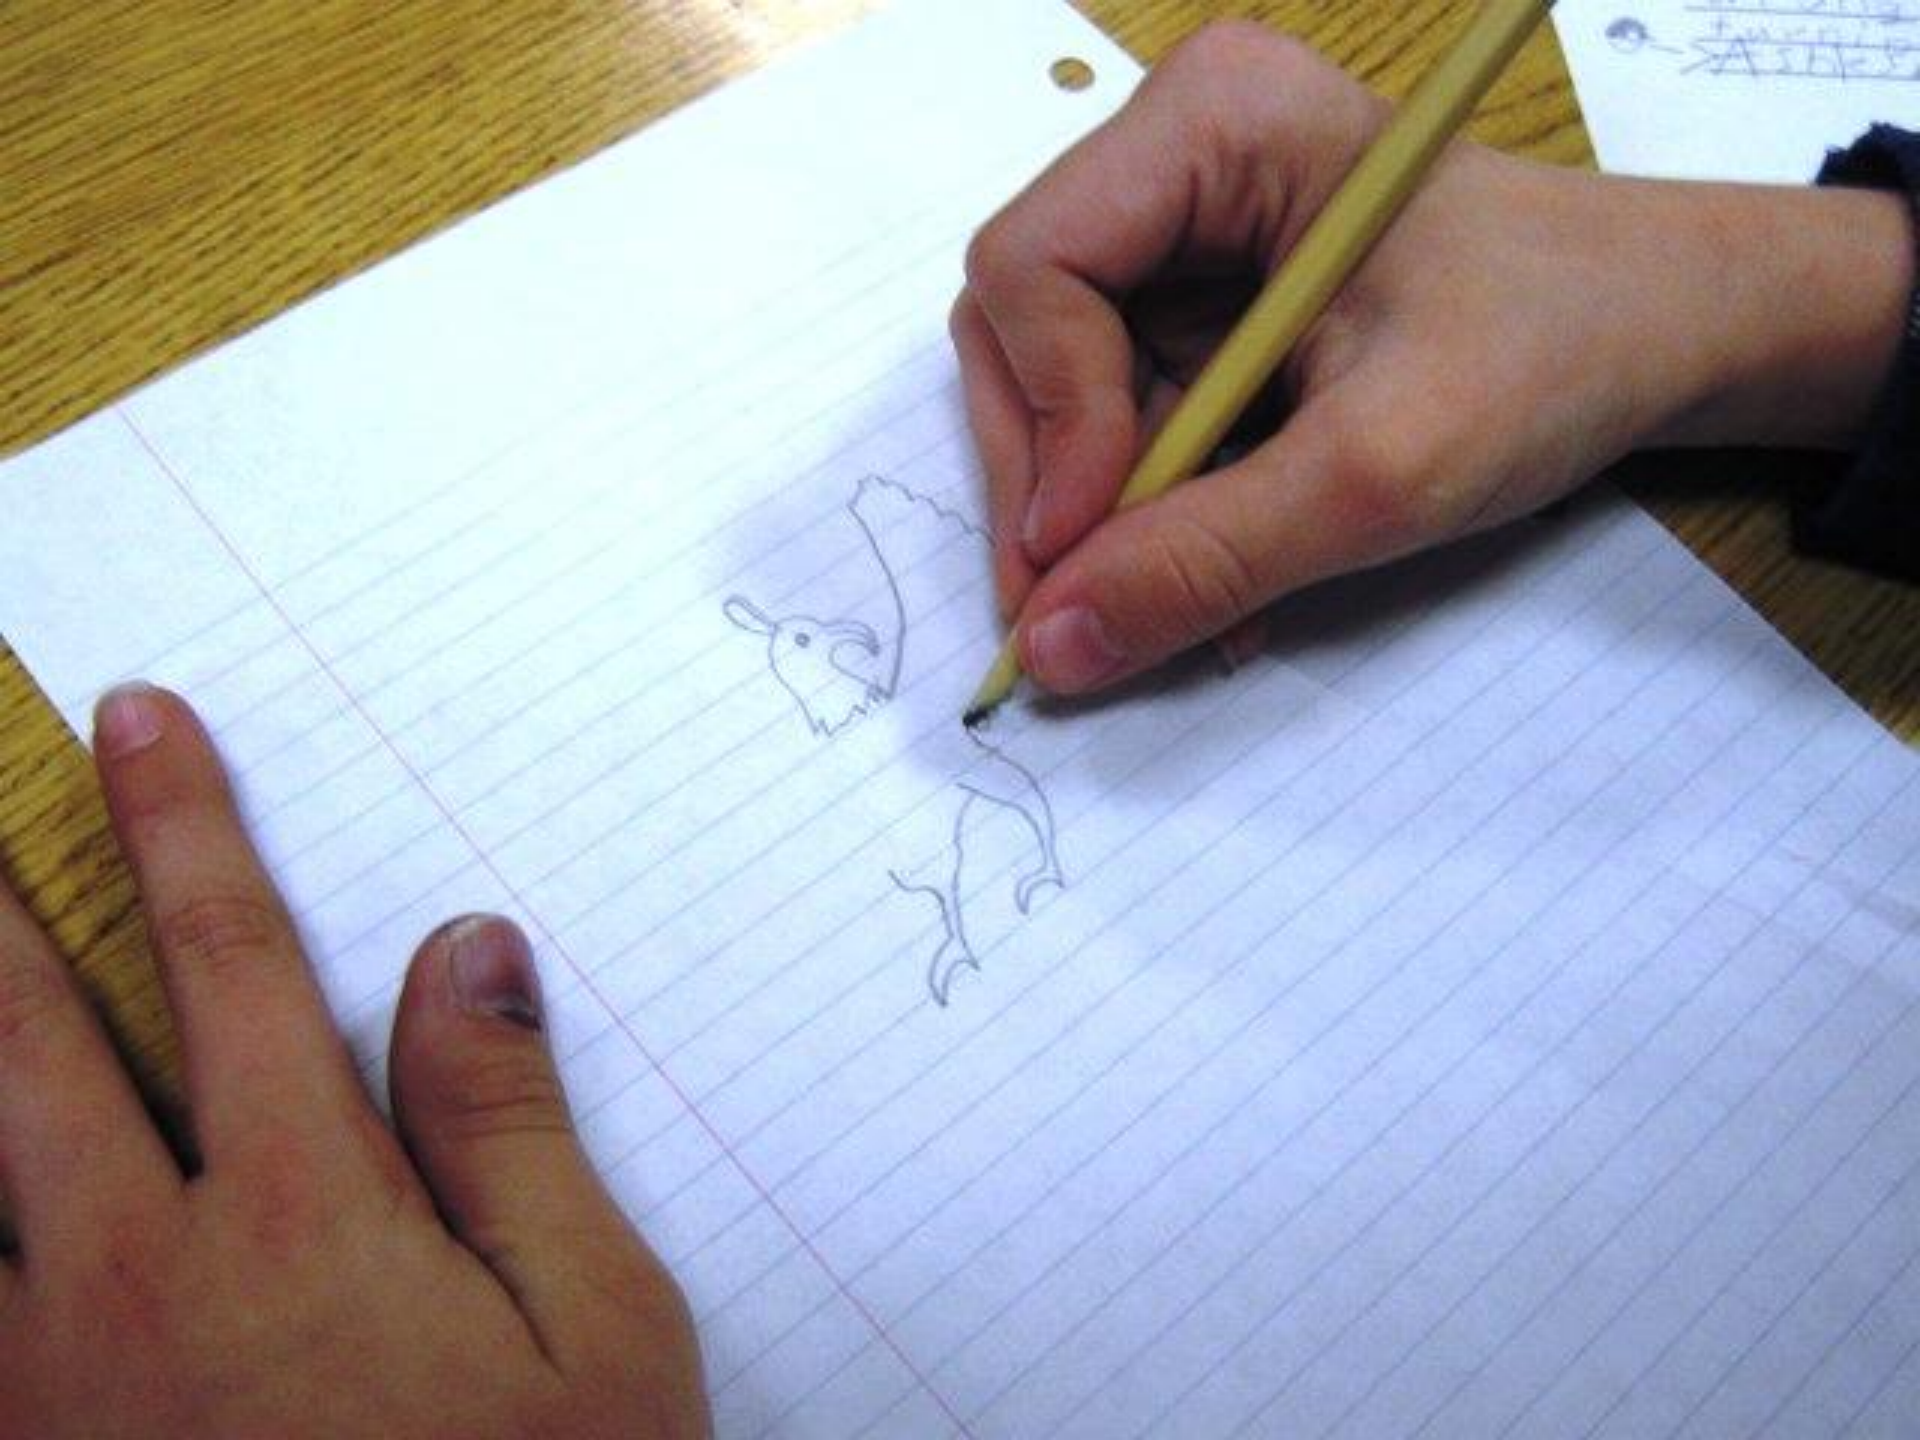

Sometimes changes are in, like when water evaporates. Sometimes changes are bad, like a glass breaking. If you give an paper, it is still paper.
